UCI Adult income dataset - Data cleaning and preprocessing

In this notebook, we focus on **data preparation**, **cleaning**, and **preprocessing** for the **UCI Adult Income Dataset**, a popular dataset often used for classification tasks predicting whether an individual earns more or less than \$50,000 annually based on demographic and work-related attributes.

Good data preprocessing is crucial for reliable and interpretable results in machine learning and analytics workflows. Here, we address common data issues such as **missing values**, **duplicates**, **and inconsistent categorical labels** while creating derived features to improve downstream analysis.

We start by importing essential Python libraries for data handling and manipulation.

- pandas for structured data operations.
- numpy for numerical operations.
- os for interacting with the operating system and directory structures.

```
# Import libraries
import pandas as pd
import numpy as np
import os
```

Define and Create Directory Paths

To ensure reproducibility and organized storage, we programmatically create directories for:

- raw data
- processed data
- results
- documentation

These directories will store intermediate and final outputs for reproducibility.

```
# Get working directory
current_dir = os.getcwd()
# Go one directory up to the root directory
project_root_dir = os.path.dirname(current_dir)
#define paths to the data folders
data_dir = os.path.join(project_root_dir, 'data')
raw_dir = os.path.join(data_dir,'raw')
processed_dir = os.path.join(data_dir,'processed')
# Define paths to results folder
result_dir = os.path.join(project_root_dir, 'results')
# Define paths to docs folder
docs_dir = os.path.join(project_root_dir,'docs')
# create directories if they do not exist
os.makedirs(raw_dir,exist_ok= True)
os.makedirs(processed_dir,exist_ok= True)
os.makedirs(result_dir,exist_ok= True)
os.makedirs(docs_dir,exist_ok= True)
```

Read in the data

We load the **Adult Income dataset** as a CSV file.

Key considerations here are:

- We treat? as missing values (na_values = '?').
- We use skipinitialspace = True to remove extra spaces after delimeters which is common in text-based datasets.

After loading, we inspect the first few rows.

```
adult_data_filename = os.path.join(raw_dir,"adult.csv")
adult_df = pd.read_csv(adult_data_filename,header=None, na_values="?",skipinitialspace=True)
adult_df.head(10)
```

	0	1	2	3	4	5	6	7
0	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical	Not-in-famil
1	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband

5	37	Private	284582	Masters	14	Married-civ-spouse	Exec-managerial	Wife
6	49	Private	160187	9th	5	Married-spouse-absent	Other-service	Not-in-famil
7	52	Self-emp-not-inc	209642	HS-grad	9	Married-civ-spouse	Exec-managerial	Husband
8	31	Private	45781	Masters	14	Never-married	Prof-specialty	Not-in-famil
9	42	Private	159449	Bachelors	13	Married-civ-spouse	Exec-managerial	Husband

We also inspect the dataset's shape. We see that the data has **32,561** rows and **15** columns.

adult_df.shape

(32561, 15)

In addition, we check the data types using .info.

adult_df.info()

<class 'pandas.core.frame.DataFrame'>

Data Cleaning

1. Assign proper column names to the columns

One of the most stricking things from the above inspection is that the dataset lacks explicit column headers. We manually assign descriptive meaningful column names based on the description of the dataset. This is critical for readability and interpretability in the subsequent steps.

	age	workclass	fnlwgt	education	education_num	marital_status	occupation
0	39	State-gov	77516	Bachelors	13	Never-married	Adm-clerical
1	50	Self-emp-not-inc	83311	Bachelors	13	Married-civ-spouse	Exec-manageri
2	38	Private	215646	HS-grad	9	Divorced	Handlers-clean
3	53	Private	234721	11th	7	Married-civ-spouse	Handlers-clean
4	28	Private	338409	Bachelors	13	Married-civ-spouse	Prof-specialty
		•••			•••	•••	•••
32556	27	Private	257302	Assoc-acdm	12	Married-civ-spouse	Tech-support
32557	40	Private	154374	HS-grad	9	Married-civ-spouse	Machine-op-ins
32558	58	Private	151910	HS-grad	9	Widowed	Adm-clerical
32559	22	Private	201490	HS-grad	9	Never-married	Adm-clerical
32560	52	Self-emp-inc	287927	HS-grad	9	Married-civ-spouse	Exec-manageri

2. Understanding the dataset

Before proceeding with the cleaning, we would like to understanding the variables deeply. This would help guide the cleaning process. The subsequent tables detail the types, meaning and values or ranges of the variables in the dataset.

Table 1: Summary table of the variables in the dataset

Variable	Type	Description	Values / Range (excluding nan)
age	Numeric	Age in years	17 - 90
fnlwgt	Numeric	Final sampling weight	$\sim 12,\!285 - 1,\!484,\!705$
$education_num$	Numeric	Education level in years	1-16

Variable	Type	Description	Values / Range (excluding nan)
capital_gain	Numeric	Capital gain amounts (Profit from selling assets above purchase price within the survey year (in USD))	0 - 99,999
capital_loss	Numeric	Capital loss amounts (Loss from selling assets below purchase price within the survey year (in USD))	0 - 4,356
hours_per_week	Numeric	Weekly work hours	1 - 99
workclass	Categorical	Type of employment	8 categories
education	Categorical	Highest level of education achieved	16 categories
$marital_status$	Categorical	Marital status	7 categories
occupation	Categorical	Type of job	14 categories
relationship	Categorical	Relationship within household	6 categories
race	Categorical	Ethnic/racial group	5 categories
sex	Categorical	Gender	2 categories
native_country	Categorical	Country of origin	41 categories
income	Categorical	Income category (target variable)	2 categories: <=50K, >50K

Table 2: Categorical Variables Table | Variable | Unique Value | Description | :--- | | workclass | Private | Works for a private, for-profit company | | | Self-emp-not-inc | Self-employed without incorporated business status | | | Self-emp-inc | Self-employed with an incorporated business | | Federal-gov | Employed by the federal government | | State-gov | Employed by a state government | | | Local-gov | Employed by a local government | | | Without-pay | Works without receiving pay (e.g. unpaid family worker) | | | Never-worked | Has never worked in their lifetime | | education | Bachelors | Bachelor's degree | | | Some-college | Some college courses completed, no degree | | | 11th | 11th grade completed | | | HS-grad | High school graduate | | | Prof-school | Professional school (e.g. law, medicine) | | | Assoc-acdm | Associate degree (academic) | | | Assoc-voc | Associate degree (vocational) | | 9th | 9th grade completed | | 7th-8th | 7th or 8th grade completed | | | 12th | 12th grade, no diploma | | | Masters | Master's degree | | | 1st-4th | 1st to 4th grade completed | | 10th | 10th grade completed | | Doctorate | Doctoral degree | | | 5th-6th | 5th or 6th grade completed | | | Preschool | Preschool education | marital-status | Married-civ-spouse | Married, living with spouse | | Divorced | Divorced legally | | | Never-married | Never married | | | Separated | Separated legally but not divorced | | Widowed | Spouse deceased | | Married-spouse-absent Married, spouse not present (e.g. estrangement) | | | Married-AF-spouse | Married to a spouse who is a member of the Armed Forces | occupation | Tech-support | Technical support jobs | | Craft-repair | Skilled manual trade and repair jobs | | | Other-service | Services not classified elsewhere | | | Sales Sales-related jobs | | | Exec-managerial | Executive and managerial roles | | | Prof-specialty |

Professional specialty occupations (e.g. scientist, lawyer) | | | Handlers-cleaners | Manual labor jobs involving cleaning, handling objects | | | Machine-op-inspct | Machine operators, inspectors | | Adm-clerical | Administrative and clerical jobs | | Farming-fishing | Agriculture, farming, fishing occupations | | | Transport-moving | Transport and moving equipment operators | | | Priv-house-sery | Private household service jobs | | | Protective-sery | Protective service jobs Female spouse | | | Own-child | Biological or adopted child | | | Husband | Male spouse Not-in-family Not part of a family unit (e.g. living alone) | | Other-relative | Other relative in household | | Unmarried | Single person, not married | | race | White | White | | | Asian-Pac-Islander | Asian or Pacific Islander | | | Amer-Indian-Eskimo | American Indian or Eskimo | | Other | Other race not listed | | Black | Black | sex | Female | Female | | Male | Male | | native-country | United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinidad-Tobago, Peru, Hong, Holland-Netherlands income | < =50 K | Income less than or equal to USD 50,000 | | | >50 K | Income greater than USD 50,000 |

```
np.unique(adult_df.income.to_list())
```

```
array(['<=50K', '>50K'], dtype='<U5')
```

3.Deal with missing values

adult_df.isnull().sum()

age	0
workclass	1836
fnlwgt	0
education	0
education_num	0
marital_status	0
occupation	1843
relationship	0
race	0
sex	0
capital_gain	0
capital_loss	0
hours_per_week	0

```
native_country 583
income 0
dtype: int64
```

Using .isnull().sum(), we identify columns with missing values. They are:

- workclass with 1,836 missing values
- occupation with 1,843 missing values
- native_country with 583 missing values

We address these by:

- Imputing categorical missing values with Unknown for the columns workclass and occupation
- Imputing categorical missing values with Other for the column native_country

This has been done to preserve data consistency while acknowledging uncertainity.

```
adult_df["workclass"] = adult_df["workclass"].fillna("unknown")
adult_df["native_country"] = adult_df["native_country"].fillna("other")
adult_df["occupation"] = adult_df["occupation"].fillna("unknown")
```

We inspect one more time to ensure we don't have any missing values.

```
adult_df.isnull().sum()
```

```
0
age
                   0
workclass
fnlwgt
                   0
education
                   0
education_num
                   0
marital_status
                   0
occupation
                   0
relationship
                   0
                   0
race
                   0
sex
capital_gain
                   0
capital_loss
                   0
hours_per_week
                   0
native_country
                   0
income
dtype: int64
```

4. Removing Duplicates

Duplicates can distort statistical summaries and model performance. Using .duplicated().sum(), we count duplicate records.

We then inspect the duplicated records.

```
adult_df.duplicated().sum()
```

24

adult_df[adult_df.duplicated(keep=False)]

32404	35	Private	379959	HS-grad	9	Divorced	Other-service

Finally, we remove them with .drop_duplicates().

```
adult_df= adult_df.drop_duplicates()
```

We can confirm that we have no duplicates left in the dataset at this juncture.

```
adult_df.duplicated().sum()
```

0

We also inspect the current shape of the dataset and see that we have 32,537 rows and 15 columns.

```
adult_df.shape
```

(32537, 15)

5. Standardize Categorical Variables

Remove any leading or trailing spaces and convert the strings to lowercase

To prepare categorical variables for consistent processing, we first of all remove extra spaces and convert them to lowercase. This step ensures categorical variables are clean and consistently organized.

```
categorical_cols = adult_df.columns[adult_df.dtypes == object]
for col in categorical_cols:
    adult_df.loc[:,col] = adult_df[col].str.strip().str.lower()
```

adult_df

Re-code the workclass column

We map the workclass column to broader categories like government, private, self-employed, etc.

Table 3: Re-encoding of the workclass column

Old categories	New Categories
state-gov	government
local-gov	government
federal-gov	government
self-emp-not-inc	self-employed
self-emp-inc	self-employed
never-worked	unemployed

Old categories	New Categories
without-pay	voluntary

adult_df["workclass"].unique()

```
adult_df.loc[:,"workclass"] = adult_df["workclass"].replace({
    "state-gov": "government",
    "local-gov": "government",
    "federal-gov": "government",
    "self-emp-not-inc":"self-employed",
    "self-emp-inc": "self-employed",
    "never-worked":"unemployed",
    "without-pay": "voluntary"
})
```

```
adult_df["workclass"].unique()
```

Re-code the education column

We create a new colum education_level with broader education groups. The mapping from education to education_level is as follows:

Table 4: Mapping from education to education_level

Education	Education Level
bachelors	tertiary
masters	tertiary
doctorate	tertiary
prof-school	tertiary
some-college	some college
assoc-acdm	associate
assoc-voc	associate
assoc-voc	associate

Education	Education Level
hs-grad	secondary-school graduate
12th	secondary
11th	secondary
10th	secondary
9th	secondary
7th-8th	primary
5th-6th	primary
1st-4th	primary
preschool	preschool

adult_df.loc[:,"education"].unique()

"some-college": "some college"

})

```
array(['bachelors', 'hs-grad', '11th', 'masters', '9th', 'some-college',
       'assoc-acdm', 'assoc-voc', '7th-8th', 'doctorate', 'prof-school',
       '5th-6th', '10th', '1st-4th', 'preschool', '12th'], dtype=object)
adult_df.loc[:,"education_level"] = adult_df["education"].map({
    "bachelors": "tertiary",
    "masters": "tertiary",
    "doctorate": "tertiary",
    "prof-school": "tertiary",
    "assoc-acdm": "associate",
    "assoc-voc": "associate",
    "hs-grad": "secondary-school graduate",
    "12th": "secondary",
    "11th": "secondary",
    "10th": "secondary",
    "9th": "secondary",
    "7th-8th": "primary",
    "5th-6th": "primary",
    "1st-4th": "primary",
    "preschool": "preschool",
```

C:\Users\USER\AppData\Local\Temp\ipykernel_29012\3484065702.py:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guid-adult_df.loc[:,"education_level"] = adult_df["education"].map({

adult_df.columns

adult_df["education_level"].unique()

Re-code the marital_status column

The categories inmarital_status are simplified into single, married, divorced or separated and widowed. See Table 5 for details.

Table 5: Re-encoding of the marital_status column

Old categories	New categories			
never-married	single			
married-civ-spouse	married			
married-spouse-absent	divorced or separated			
divorced	divorced or separated			
separated	divorced or separated			
married-af-spouse	married			

adult_df["marital_status"].unique()

```
adult_df.loc[:,"marital_status"] = adult_df["marital_status"].replace({
    "never-married": "single",
    "married-civ-spouse": "married",
    "married-spouse-absent": "divorced or separated",
    "divorced":"divorced or separated",
    "separated": "divorced or separated",
    "married-af-spouse":"married"
})
```

```
adult_df["marital_status"].unique()
```

Re-code the occupation column

A new column, occupation_grouped, is created. This new column groups the occupations into the categories white collar, blue collar, service, unknown and military. The exact map ping is illustrated in Table 6.

Occupation	Occupation Grouped			
adm-clerical	white collar			
exec-managerial	white collar			
handlers-cleaners	blue collar			
prof-specialty	white collar			
other-service	service			
sales	white collar			
craft-repair	blue collar			
transport-moving	blue collar			
farming-fishing	blue collar			
machine-op-inspct	blue collar			
tech-support	white collar			
protective-serv	service			
armed-forces	military			
priv-house-serv	service			
unknown	unknown			

```
adult_df["occupation"].unique()
```

```
array(['adm-clerical', 'exec-managerial', 'handlers-cleaners',
       'prof-specialty', 'other-service', 'sales', 'craft-repair',
       'transport-moving', 'farming-fishing', 'machine-op-inspct',
       'tech-support', 'unknown', 'protective-serv', 'armed-forces',
       'priv-house-serv'], dtype=object)
adult_df.loc[:,'occupation_grouped'] = adult_df['occupation'].map({
    'adm-clerical': 'white collar',
    'exec-managerial': 'white collar',
    'handlers-cleaners': 'blue collar',
    'prof-specialty': 'white collar',
    'other-service': 'service',
    'sales': 'white collar',
    'craft-repair': 'blue collar',
    'transport-moving': 'blue collar',
    'farming-fishing': 'blue collar',
    'machine-op-inspct': 'blue collar',
    'tech-support': 'white collar',
    'protective-serv': 'service',
    'armed-forces': 'military',
    'priv-house-serv': 'service',
    'unknown': 'unknown'
})
C:\Users\USER\AppData\Local\Temp\ipykernel_29012\3212035601.py:1: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guid-
  adult_df.loc[:,'occupation_grouped'] = adult_df['occupation'].map({
adult_df["occupation_grouped"].unique()
array(['white collar', 'blue collar', 'service', 'unknown', 'military'],
      dtype=object)
Re-code the relationship column
```

We normalize the race column to indicate roles within a family or individual status.

Table 7 shows the re-encoding:

Table 7: Re-encoding of the race column

Old relationship	New relationship
wife	female spouse
own-child	child
not-in-family	single
other-relative	extended relative
unmarried	single
husband	male spouse

```
adult_df["relationship"].unique()
```

Re-code the race column

We standardize the race column to have more clear names. Table 8 shows the record values that were re-encoded:

Table 8: Re-encoding of the race column

Old categories	New categories
asian-pac-islander	asian or pacific islander
amer-indian-eskimo	american indian or eskimo

```
adult_df["race"].unique()
```

Re-code the native_country column

We create a new colum native_region which maps native_country to geographical regions (e.g., north america, asia, etc.). The mapping is as follows:

Table 9: Mapping from native_country to native_region

Native_country	Native_Region		
united-states	north america		
canada	north america		
puerto-rico	north america		
<pre>outlying-us(guam-usvi-etc)</pre>	north america		
mexico	north america		
cuba	central america		
jamaica	central america		
honduras	central america		
dominican-republic	central america		
el-salvador	central america		
guatemala	central america		
nicaragua	central america		
trinadad&tobago	central america		
haiti	central america		

Native_country	Native_Region				
columbia	south america				
ecuador	south america				
peru	south america				
south	south america				
india	asia

32560	52	self-employed	287927	hs-grad	9	married	exec-manageria

```
#adult_df.to_csv("9.csv",index=False)
```

6. Create age groups based on the age column

Age is binned into groups such as <18, 18-25, \cdots , 76+ to facilitate easier demographic analysis.

```
adult_df["age"].unique()
array([39, 50, 38, 53, 28, 37, 49, 52, 31, 42, 30, 23, 32, 40, 34, 25, 43,
       54, 35, 59, 56, 19, 20, 45, 22, 48, 21, 24, 57, 44, 41, 29, 18, 47,
       46, 36, 79, 27, 67, 33, 76, 17, 55, 61, 70, 64, 71, 68, 66, 51, 58,
       26, 60, 90, 75, 65, 77, 62, 63, 80, 72, 74, 69, 73, 81, 78, 88, 82,
       83, 84, 85, 86, 87], dtype=int64)
bins = [0,18,25,35,45,60,75,100]
labels = ["<18","18-25","26-35","36-45","46-60","61-75","76+"]
adult_df.loc[:, "age_group"] = pd.cut(adult_df["age"], bins = bins, labels = labels, right = True,
adult_df["age_group"].unique()
C:\Users\USER\AppData\Local\Temp\ipykernel_29012\639405665.py:3: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead
See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guide
  adult_df.loc[:, "age_group"] = pd.cut(adult_df["age"], bins = bins, labels = labels, right = True
['36-45', '46-60', '26-35', '18-25', '<18', '76+', '61-75']
Categories (7, object): ['<18' < '18-25' < '26-35' < '36-45' < '46-60' < '61-75' < '76+']
```

7. Drop unnecessary columns

After recoding, some columns such as education, native_country and occupation become redundant. We drop them to avoid multicollinearity and simplify our dataset. We notably retain the age column in case there is need to model it as a continuous variable.

```
adult_df.drop(columns=["education", "native_country", "occupation"], inplace=True)
```

```
C:\Users\USER\AppData\Local\Temp\ipykernel_29012\597147441.py:1: SettingWithCopyWarning: A value is trying to be set on a copy of a slice from a DataFrame
```

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guid-adult_df.drop(columns=["education","native_country","occupation"],inplace=True)

```
adult_df.columns
```

Save the Clean Dataset

Before saving the clean dataset, we re-inspect it to ensure no new issues have risen up due to re-encoding. We first of all inspect the shape of the dataset. We see that we have 32,537 rows and 16 columns. This means that there is a new column, age_group, added to the original dataset.

```
adult_df.shape
```

```
(32537, 16)
```

We confirm that there are no null values.

adult_df.isna().sum()

```
0
age
                        0
workclass
fnlwgt
                        0
education_num
                        0
marital_status
                        0
relationship
                        0
                        0
race
sex
                        0
                        0
capital_gain
                        0
capital_loss
hours_per_week
                        0
```

```
income 0
education_level 0
occupation_grouped 0
native_region 0
age_group 0
dtype: int64
```

However, we note that there are new duplicated values given that we merged some categories in the re-encoding process. We inadvertently drop the duplicates.

```
adult_df.duplicated().sum()
```

24

```
adult_df = adult_df.drop_duplicates()
adult_df.duplicated().sum()
```

0

The final shape of the clean dataset is thus 32,513 rows and 16 columns.

```
adult_df.shape
```

```
(32513, 16)
```

Finally, we save the clean, processed dataset as a CSV file in our processed directory for future modelling and analysis.

```
# save the file in the processed data folder
final_file = os.path.join(processed_dir,"adult_cleaned.csv")
adult_df.to_csv(final_file,index=False)
```
